LA VIVENZIA

LA VIVENZIA CRM

End-to-End Business Flows

How the CRM captures, manages, onboards and grows relationships

1. Lead Capture → Qualification → Assignment
2. Lead → Interaction → Follow-up → Conversion
3. Onboarding → Document Verification → Approval
4. CRM Intelligence → Next Best Action
5. Complete La Vivenzia Relationship Lifecycle

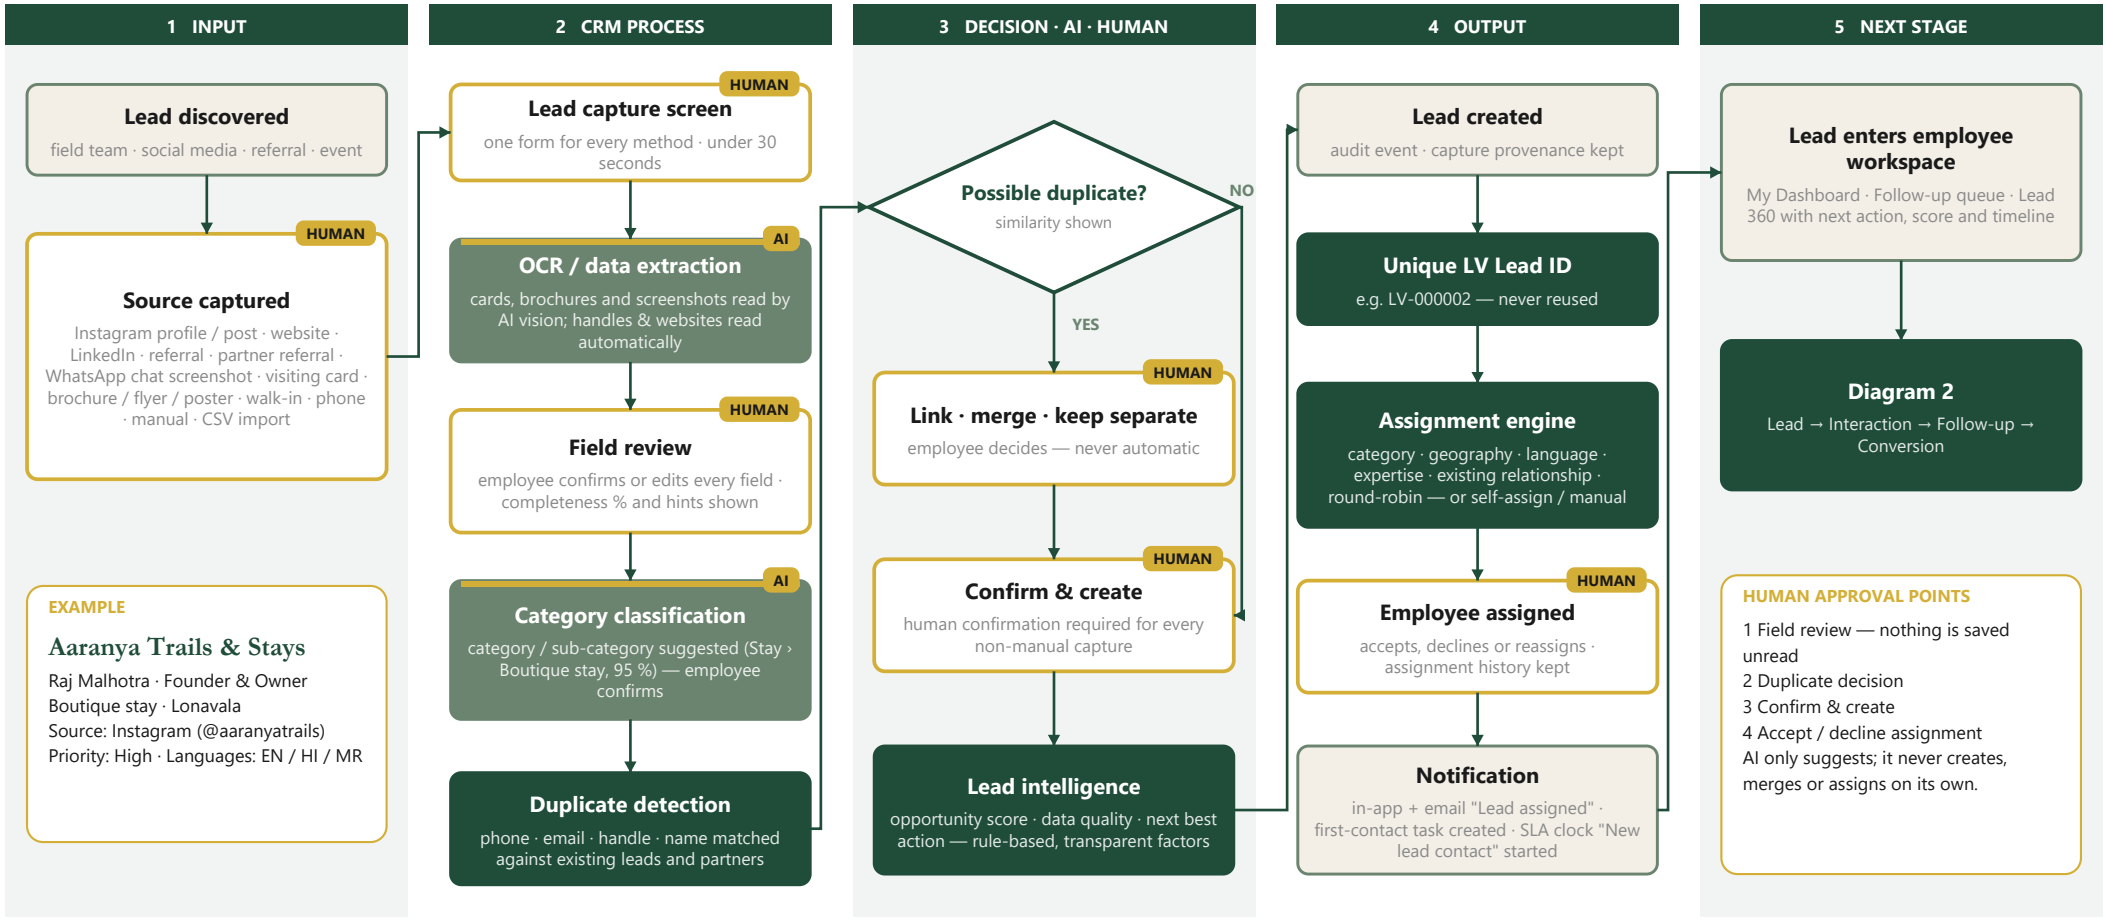

Prepared for Tejas Natani and Ashish · Founder presentation · September 2026

Every block reflects functionality implemented in the CRM today; items not yet built are marked PLANNED / FUTURE.

DIAGRAM 1

Lead Capture → Qualification → Assignment

From a lead discovered in the field to a lead sitting in an employee's workspace

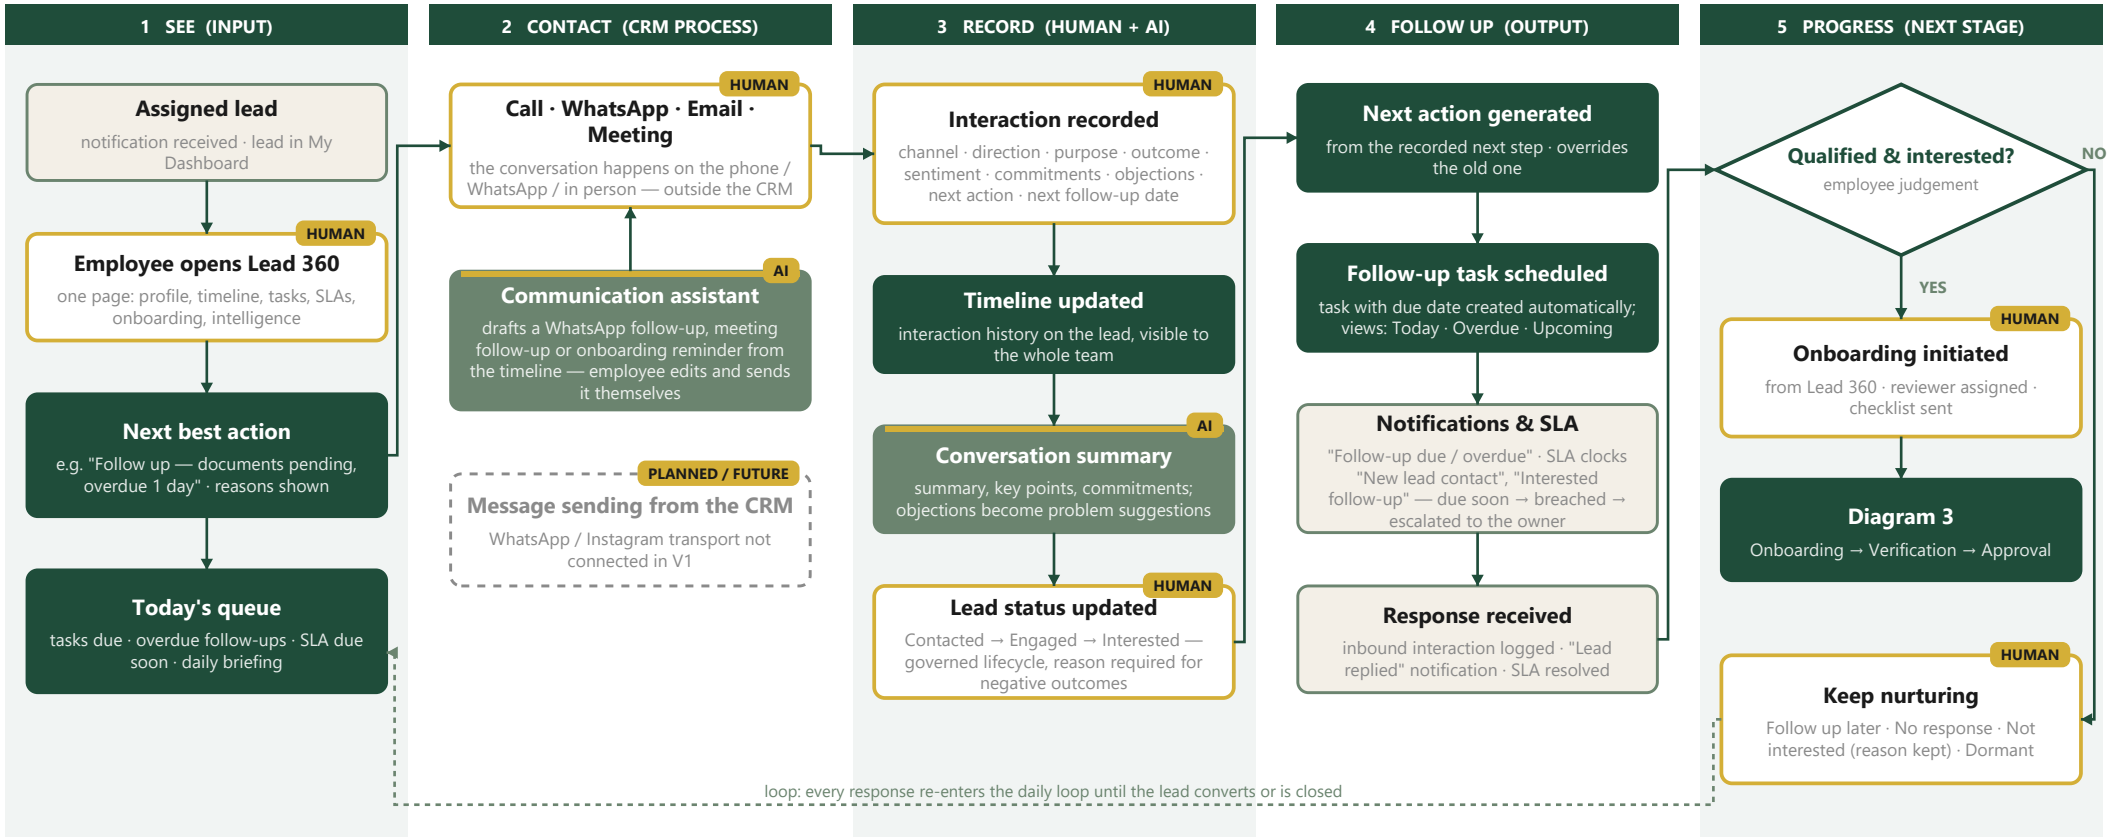

LEAD STATUS DURING THIS FLOW

Discovered → New → Qualifying → Assigned

Every capture, review, duplicate decision, creation and assignment writes an audit event (who, what, when, outcome). Capture works from a phone: a lead can be captured in the field in under a minute and completed later at the desk.

Automated · AI-assisted · Human action · System event / record · Planned / future · Decision

Lead → Interaction → Follow-up → Conversion

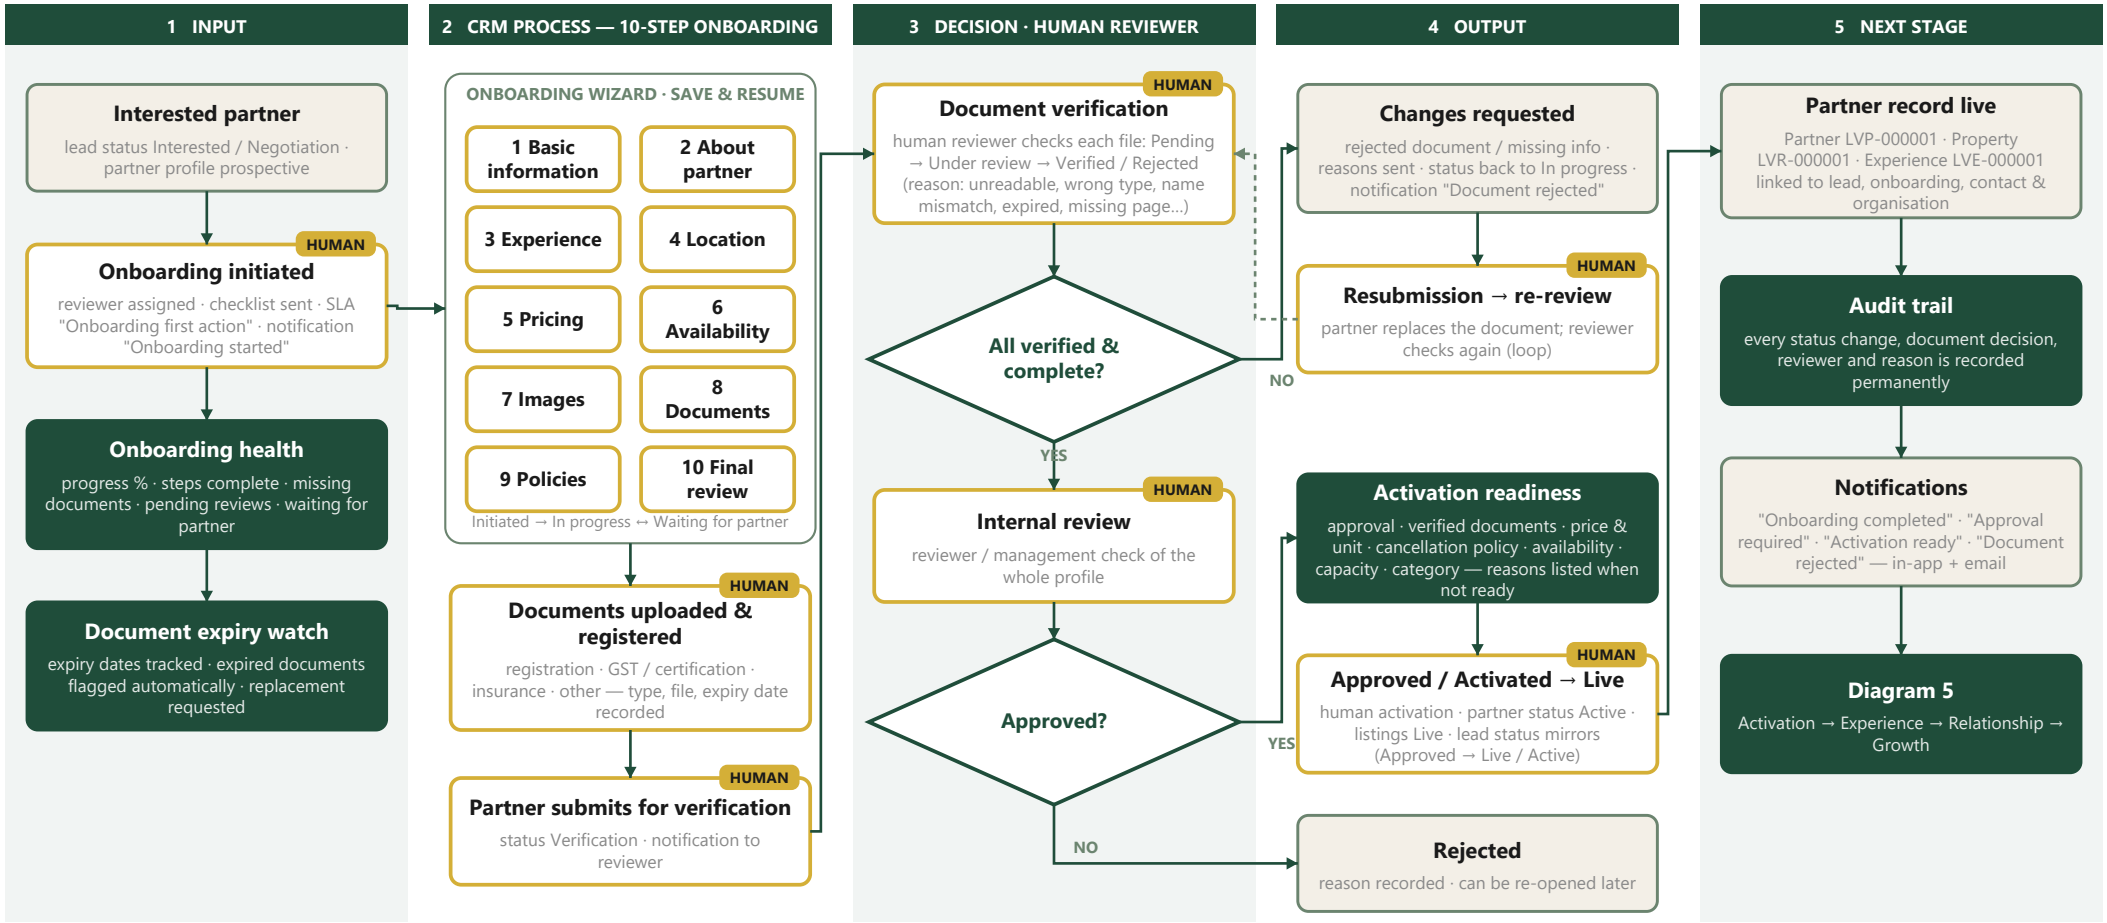

THE EMPLOYEE'S DAILY WORKFLOW

SEE → CONTACT → RECORD → FOLLOW UP → PROGRESS

Automated · AI-assisted · Human action · System event / record · Planned / future · Decision

Nothing about the relationship lives in someone's head or phone: every call, message and meeting is recorded once, and the CRM turns it into the next task, the timeline, the status and the numbers on the dashboards. Aaranya example: 7 interactions from the Instagram DM on 5 Sep to the documents received on 17 Sep, 3 status changes, 2 SLA clocks resolved.

Onboarding → Document Verification → Approval

ONBOARDING STATUS

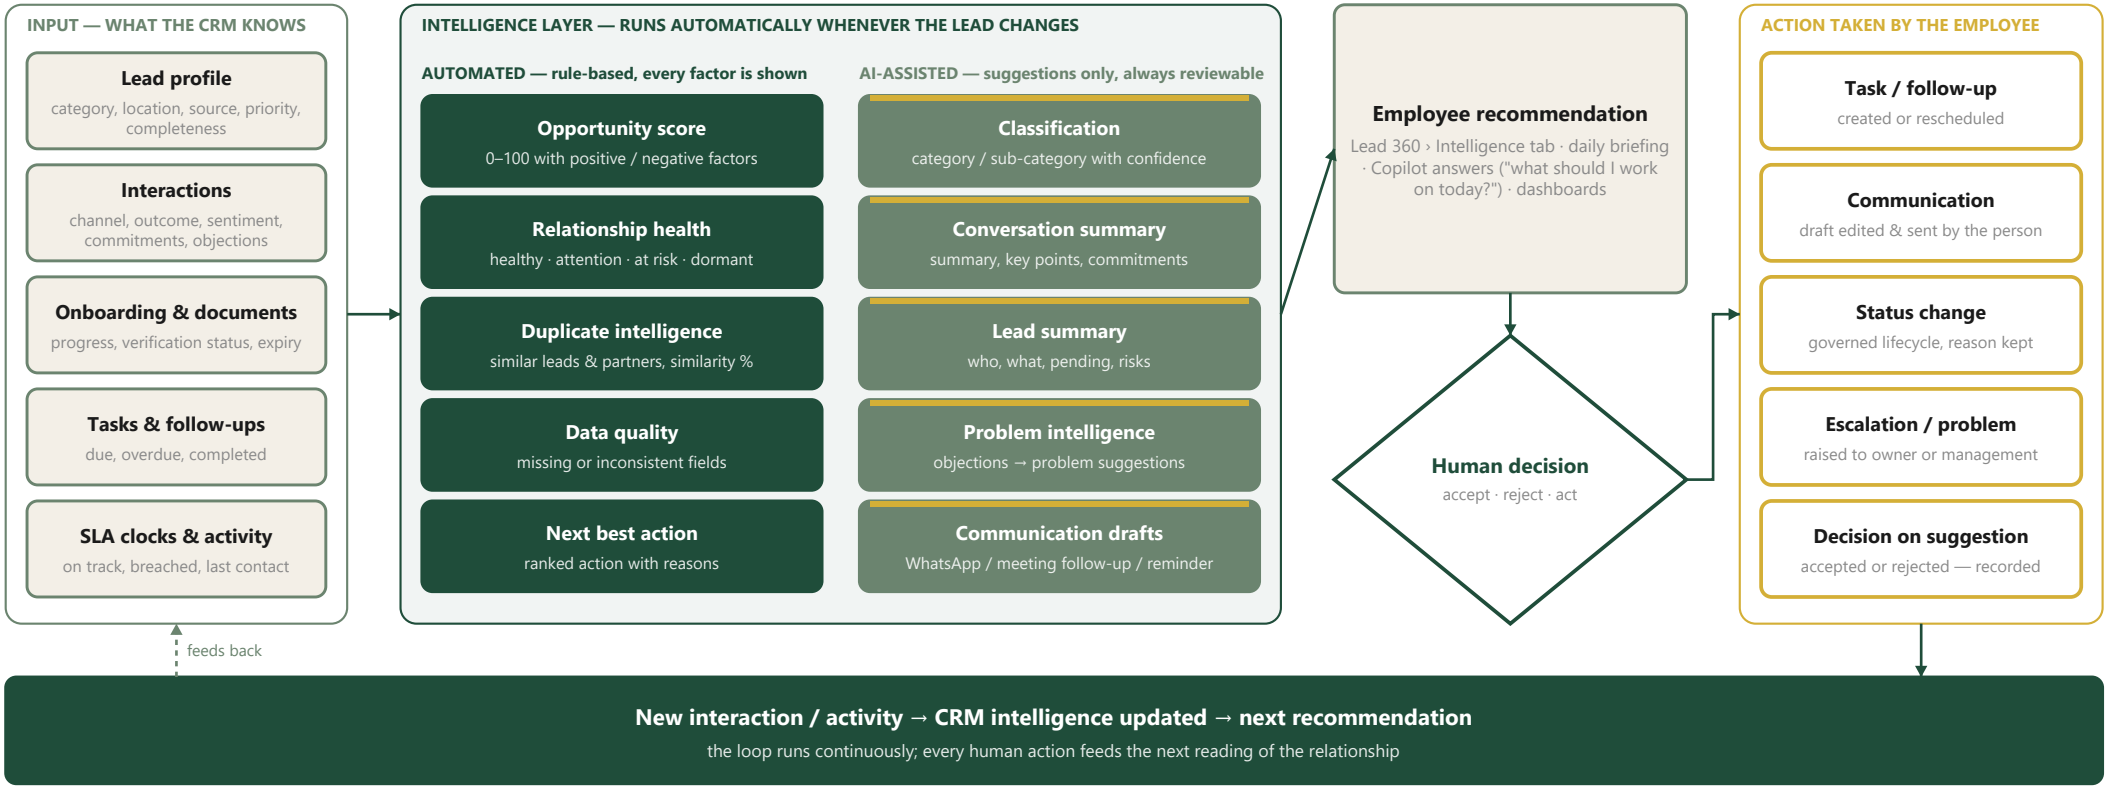

Initiated → In progress → Waiting for partner → Verification → Internal review → Changes requested → Approved → Rejected → Activated

Aaranya example (production demo): onboarding In progress, 70 %, step Documents — property registration Verified, GST certificate Verified, insurance certificate Under review, experience information Pending. AI never verifies, approves or rejects a document or a partner: those actions are taken by a named reviewer and written to the audit trail.

Automated · AI-assisted · Human action · System event / record · Planned / future · Decision

CRM Intelligence → Next Best Action

How the CRM reads everything known about a lead and turns it into a recommendation a person decides on

Boundary: AI never approves or rejects a partner, verifies a document, changes ownership, deletes records or sets commercial terms — these are human actions, recorded in the audit trail.

WHAT THIS MEANS FOR THE TEAM

Automated

Scores, health, duplicates, data quality and next best action are computed from CRM records with transparent factors — no black box. They refresh on every change.

AI-assisted

Summaries, classification, problem and draft suggestions are generated on request or after an interaction, labelled as suggestions, and accepted or rejected by a person. If the AI service is unavailable, the CRM keeps working.

Human decision

Every consequential action — contact, status, task, escalation, approval — is taken by a named employee and recorded in the audit trail. Aaranya example: score 90, health Attention (overdue follow-up), next best action Follow up.

Automated · AI-assisted · Human action · System event / record · Planned / future · Decision

DIAGRAM 5

Complete La Vivenzia Relationship Lifecycle

The master flow: eleven stages, the CRM systems that carry them, and the Experience Graph they build

RELATIONSHIP LIFECYCLE · lead status → onboarding status → partner status

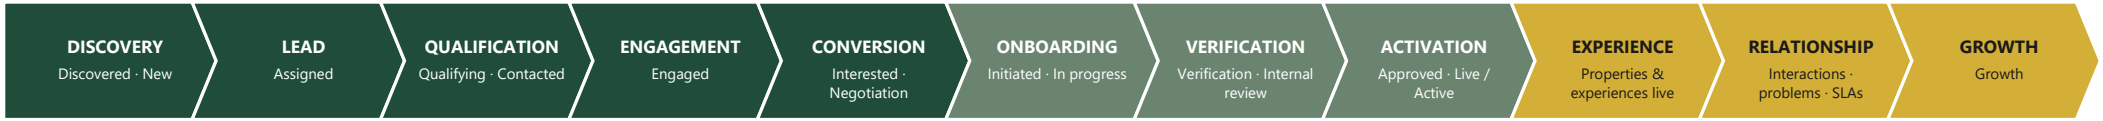

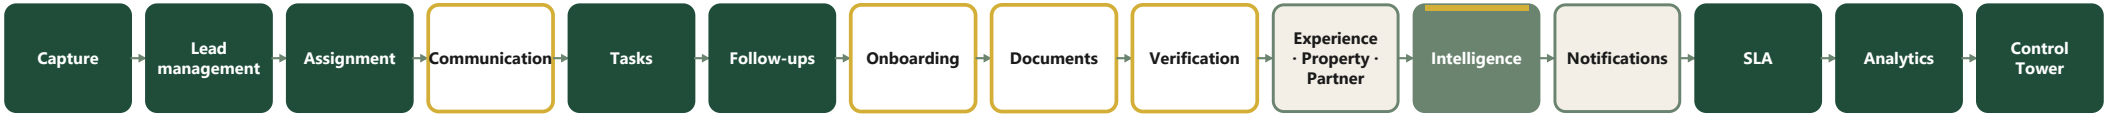

Diagram 1 — Capture → Qualification → Assignment

Diagram 2 — Interaction → Follow-up → Conversion

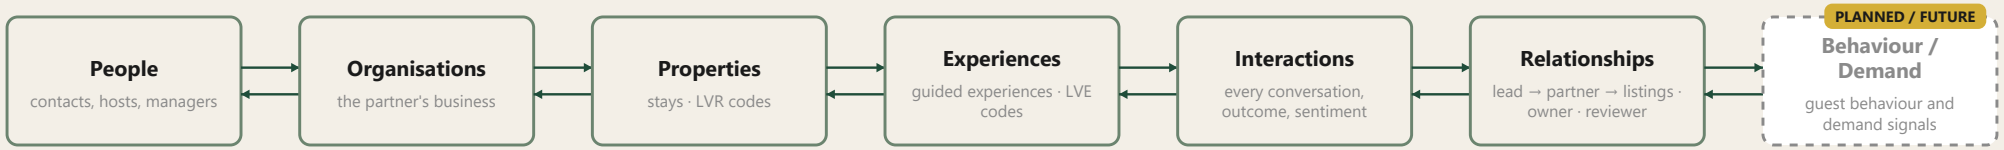

Diagram 3 — Onboarding → Verification → Approval

Diagram 4 — Intelligence → Next best action (runs across every stage)

CRM SYSTEMS THAT CARRY EACH STAGE

THE EXPERIENCE GRAPH — what the CRM builds over time

Today the graph is built from linked CRM records: a partner links its lead, onboarding, contact person and organisation; every property has a manager and every experience a host; every interaction, task, document and decision hangs off the lead. Aaranya: 1 organisation · 3 people · 1 lead · 7 interactions · 1 onboarding with 4 documents · 1 partner · 1 property · 1 experience — all navigable from one another.

Behaviour / Demand (guest behaviour, bookings, revenue, feedback) needs booking and guest data the CRM does not hold in V1 — it is the planned next layer, fed by the CRM, not built inside it.

HOW TO READ THE MASTER FLOW

Stages 1–5 · Lead

Captured once, assigned by rules, worked through the daily loop until the partner is interested. Status is governed: only allowed moves, reasons on negative outcomes.

Stages 6–8 · Partner

A ten-step onboarding with human document verification and a human approval gate. Activation readiness is checked automatically; activation is a human act.

Stages 9–11 · Relationship

Live properties and experiences, continuing interactions, problems and SLAs; the relationship keeps feeding intelligence, analytics and the Control Tower. Growth analytics on bookings: PLANNED / FUTURE.

Automated · AI-assisted · Human action · System event / record · Planned / future · Decision

How to read these diagrams

Automated

The CRM does this by itself, from rules and records — no AI involved. Examples: unique LV Lead ID, assignment engine, duplicate matching, opportunity score, SLA clocks, follow-up task creation, activation readiness, onboarding health, document expiry watch, audit trail.

AI-assisted

A suggestion generated from CRM records, labelled as a suggestion, and accepted or rejected by a person. Examples: OCR / data extraction, category classification, conversation & lead summaries, problem suggestions, communication drafts, Copilot answers. If the AI service is unavailable the CRM continues without it.

Human action

A named employee, reviewer or manager does this and the CRM records who, when and why. Examples: field review and confirm, duplicate decision, accept assignment, call / message / meet, log interaction, status change, document verification, internal review, approval, activation.

System event / record

Something that now exists or happened in the CRM: a lead, a partner, a notification, an audit event, a timeline entry, a status.

Planned / future

Described in the La Vivenzia requirements but not built in this version. Shown dashed so nothing in the deck over-claims.

Decision
YES / NO

A question answered by a person (or, for duplicates and readiness, by a rule whose factors are shown). Arrows are labelled YES / NO where the path splits.

Process sequence — what happens next.

Loop / return — the flow re-enters an earlier step (re-review, daily loop, intelligence refresh).

HUMAN AI PLANNED / FUTURE

Tags on a block repeat its nature so the diagrams also read in black and white.

Coverage note

Everything drawn as Automated, AI-assisted, Human action or System event is implemented and running in the La Vivenzia CRM (production, September 2026), and was exercised with the Aaranya Trails & Stays demonstration data. Marked PLANNED / FUTURE: sending WhatsApp / Instagram messages from inside the CRM (drafts are produced, sending is manual), the Behaviour / Demand layer of the Experience Graph, and growth analytics on bookings and revenue. Not drawn because not built: voice capture, AI reading of uploaded documents, funnel drill-down charts and category administration by non-developers.
